

Warehousing services, origination and shipping management

The B1ACM – Agribusiness Commodities Management origination and dispatch solution covers all stages of grain management and storage. It manages the purchase and sale contracts, controlling the yard logistics, the receipts, internal flow and the unloading of the trucks.

With the use of the Origination module, both the owner and third-party storage processes will be within a single platform, thus enabling managers to analyze in real time, in addition to greater control of the operation and its real costs.
